Doctor	Dr N/A		Date & Time of Receiving	09/03/2022	18:31:56
Ward/Bed			Date & Time of Reporting	09/03/2022	20:05:42

INVESTIGATIONS	RESULT	UNIT	BIOLOGICAL REFERENCE INTERVAL
SEROLOGY			
VIRAL PROFILE , Serum			
HIV I & II (Method:Chemiluminescence)	0.09 - Negative		Reactive >= 1.0 Negative < 0.90 Borderline >= 0.9 to < 1.0
Anti - HEPATITIS C VIRUS (Method:Chemiluminescence)	0.02 - Negative		Reactive >= 1.0 Negative < 0.90 Borderline >= 0.9 to < 1.0
HEPATITIS B SURFACE ANTIGEN (Method:Chemiluminescence)	0.20 - Negative		Reactive >= 1.0 Negative < 0.90 Borderline >= 0.9 to < 1.0

ANTI HIV 1 & 2

- If a specimen is reactive (result >1.00 s/c) the probability that HIV antibodies are present is high, especially in subjects at high risk for HIV infection. In most settings, it is appropriate to investigate reactive results by additional, more specific tests. Clinical correlation is indicated with appropriate counselling, medical intervention and possibly additional testing to decide whether a diagnosis of HIV infection is accurate.
- Interpretation of results from specimens found to be reactive and negative by additional, more specific tests is unclear. Further clarification may be obtained by testing another specimen obtained three to six months later.
- A negative test result does not exclude the possibility of exposure to or infection with HIV. Levels of HIV antibodies may be undetectable in the early stages of infection.

ANTI HCV

- The results from this or any other diagnostic test should be used and interpreted only in the context of the overall clinical picture.
- When Anti-HCV is detected, patient is presumed to be infected with HCV.
- A negative test result does not exclude the possibility of exposure to or infection with HCV. HCV antibodies may beundetectable in some stages of the infection and in some clinical conditions.
- Results from immunosuppressed individuals should be interpreted with caution.
